FOREWORD

Our irises are mostly of variegata origin. This is a hardy strain, as the home of the variegata is Hungary where climatic conditions are similar to those of eastern Nebraska and Iowa. They are adapted to the larger portion of the United States, but are not reliable in the warmer regions with little or no frost. In these sections they often fail to bloom or bloom on very short stems. The reason is that the variegatas are waiting for the approach of winter and as they usually start growth late in the year, they will be caught by the heat.

The variegata gives the entire color range of the bearded irises except blue. Hans and Jacob Sass used variegatas in their early experiments more frequently than any other pioneer breeders to obtain a wide color range. They used Trojana to overcome the dominance of low growth in the varigatas and gain height and infusion of Macrantha or Amas blood to increase the size of the bloom.

Plant irises in sunny, well drained locations. The rhizome, the botanical term for the creeping rootstock from which the true roots grow, should be placed just below the surface of the soil, making a hole sufficiently large to spread out the roots. Pack the soil around them, water and do not let them dry out until new growth has started. Point the growing points in the same direction when planting three or more rhizomes of the same variety. If, as so often done, they are pointed in opposite direction the result will be a clump with an open center which will not produce a solid mass of bloom. July and August are the best planting months, but they can be planted at any time the soil can be worked.

1947 INTRODUCTIONS

BIRD OF DAWNING (J. Sass, 1947)—Cameo pink self according to Ridgeway's color chart.
